

## Morfast® Liquid Dyes

### For Writing Instruments, Inks and Coatings

Sunbelt's **Morfast®** line of liquid dyes for inks are single phase dyes supplied as approximately fifty percent (50%) concentrates in n-propanol. The n-propanol serves as a viscosity depressant and standardizing agent. These dyes offer high color strength in liquid form, with low insoluble. **Morfast®** liquid dyes are true liquid dyes as opposed to solutions of powder dyes. They are low in viscosity, permitting ease of handling, and they are economical, since production time for handling and solubility is reduced.

**Morfast®** liquid dyes are compatible in all proportions with each other, and can be blended to achieve a variety of shades. They are also directly miscible and soluble in all proportions with:

N-Propanol	Higher alcohols	Ketones
Glycol ethers	Esters	Aromatic
Hydrocarbons		

**Morfast®** liquid dyes have good fastness properties, high performance properties and have a wide range of applications. These dyes easily dissolve into the solvents commonly used in:

- Permanent marking inks
- Ball point pens
- Lacquers
- Enamels
- Flexographic and gravure inks
- Decorative foil coatings
